

Gary Reid – Portfolio Website – FEWD 644

My portfolio started with the idea of a retro 1970s-1980s looking website, still responsive, still viewable on mobile phones, but big and bold like those times.

It's all designed to be responsive, though the parallax image carousel may have a bit of slippage.

When I ran the 'final' pre-submission site through an optimizer, I got a bunch of good feedback about what needs to be fixed, including a few 'critical' errors but the technical side was 91/100 and the experience rating was 100%. I'm going to get to work on those errors immediately and they will be uploaded asap at <https://grm50000.github.io/GRM14/index.html> .

I used a border-color animation on the header of each page which is subtle and slow. I wanted to use this effect more, but the page is already visually packed. I also used a gradient that is animated by motion on the parallax image carousel at <https://grm50000.github.io/GRM14/pages/parallax/index.html>

I'm not entirely satisfied with the product handed in, but I am grateful for the work in progress, and to know the direction that I want to go with this project and that I have the resources available to pursue that growth. When I get the music and the design sections fully segregated and a few more of my works incorporate, I will be more satisfied.

I used Javascript to enhance the site in using a parallax image carousel, in creating a YT video viewer embedded in the site, and creating a navbar, amongst other things.

Now to hand this in and dig further into those optimization results... Onward and upward!
